### LRU

#### Aim:

To write a c program to implement LRU page replacement algorithm.

#### Algorithm:

- 1: Start the process
- 2: Declare the size
- 3: Get the number of pages to be inserted
- 4: Get the value
- 5: Declare counter and stack
- 6: Select the least recently used page by counter value
- 7: Stack them according the selection.
- 8: Display the values
- 9: Stop the process

#### Program Code:

```
#include <stdio.h>
int findLRU (int Tumi[], int n) {
    int i, min = Tumi[0], pos = 0;
    for (i=1; i<n; i++) {
        if (Tumi[i] < min) {
            min = Tumi[i];
            pos = i;
        }
    }
    return pos;
}

int main() {
    int frames[10], pages[30], Tumi[10], counter=0,
        faults=0;
    int n, f, i, j, flag1, flag2, pos;
    printf("Enter number of frames: ");
    scanf("%d", &n);
    printf("Enter reference string: \n");
    for (j=0; j<n; j++) {
        printf("Enter page %d: ", j+1);
        scanf("%d", &pages[j]);
        Tumi[counter] = pages[j];
        counter++;
    }
    for (i=0; i<n; i++) {
        if (frames[i] == -1) {
            frames[i] = Tumi[i];
            printf("Page %d is loaded at frame %d\n", pages[i], i+1);
            faults++;
        } else {
            for (j=i+1; j<n; j++) {
                if (frames[j] == -1) {
                    frames[j] = Tumi[i];
                    printf("Page %d is loaded at frame %d\n", pages[i], j+1);
                    faults++;
                    break;
                }
            }
        }
    }
    printf("Total page faults: %d", faults);
}
```

```

for (i=0; i<n; i++) {
    scanf("%d", &pages[i]);
}
for (i=0; i<f; i++) {
    frames[i] = -1;
    turni[i] = 0;
}
printf("Page Replacement Process:\n");
for (i=0; i<n; i++) {
    flag1 = flag2 = 0;
    for (j=0; j<f; j++) {
        if (frames[j] == pages[i]) {
            counter++;
            turni[j] = counter;
            flag1 = flag2 = 1;
            break;
        }
    }
    if (flag1 == 0) {
        for (j=0; j<f; j++) {
            if (frames[j] == -1) {
                counter++;
                faults++;
                frames[j] = pages[i];
                turni[j] = counter;
                flag2 = 1;
                break;
            }
        }
    }
    if (flag2 == 0) {
        pos = findFree(turni, f);
        counter++;
        faults++;
        frames[pos] = pages[i];
        turni[pos] = counter;
    }
}

```

```
for (j=0; j < f; j++) {
    if (frames[j] != -1)
        printf("%d", frames[j]);
    else
        printf("-1");
}
printf("\n");
printf("In Total Page Faults = %d\n", faults);
return 0;
}
```

**Sample Output :**

Enter number of frames: 3  
Enter number of pages: 6  
Enter reference string: 5 7 5 6 7 3  
5 -1 -1  
5 7 -1  
5 7 -1  
5 7 6  
5 7 6  
3 7 6

Total Page Faults = 4

**Result:**

The LRU page replacement algorithm has  
~~been successfully implemented~~
